

How to generate an SSH key

Step by step guide

1. On your local machine, generate an SSH key, ensuring a good key length and type :

```
ssh-keygen -b 4096 -t rsa
```

2. Copy the public key from your computer to any of the clusters

```
ssh-copy-id <username>@fidis.epfl.ch
```

As the `/home` is shared can be done by connecting to any of the clusters and will then work for all of them.

You should now be able to login without a password on all the clusters including the data nodes.
